

The Whitenoise Secure Tunnel encrypts/decrypts all transmitted digital data between enterprise locations without any change in user behavior and without any training.

Parents inoculate children. The Systems Manager inoculates the enterprise.

Programs that run on the network are not even aware it is there. There is no additional configuration.

Put a tunnel at each enterprise location and all traffic between locations is automatically protected. There is no latency into real time communications.

Why Whitenoise? Why the tunnel? Why now?

Security is the single greatest challenge faced in today's digital world. Identity theft and piracy are two manifestations that cost us all billions of dollars.

There is not a single electronic or information technology context that would not benefit from effective security.

Enterprises should protect their intellectual property while protecting their client's identity.
